4040 North Fairfax Drive, Suite 130
Arlington, VA 22203

#### INTRODUCTION AND METHODS

For the spring 2012 season there were 4 turkey hunting units in Kansas (Figure 1). An initial turkey permit could be purchased over-the-counter for all units except Unit 4 (southwest Kansas). A second turkey game tag was also available for Units 2 and 3. The Unit 4 quota was set at 500 permits for the 2012 season and they were issued through a pre-season drawing. The permit allocation was 250 for general residents and 250 for landowner/tenants. Youth did not have to be drawn to hunt in Unit 4 as they could purchase over-the-counter permits that were valid statewide. The unit was undersubscribed this year for the second consecutive year and 45 permits were still available after the drawing. The spring 2012 season ran 61 days (Table 1) and the total number of permits issued was 63,928 (includes 22,052 game tags; Table 2).

The spring wild turkey harvest survey has been conducted annually by the Kansas Department of Wildlife, Parks, and Tourism (KDWPT) since the first regulated season was established in 1974. However, the survey methodology has changed over the years to improve efficiency, reduce costs, and improve accuracy of estimates. The 2012 survey was conducted by selecting a random sample of hunters from all the people who provided e-mail addresses when they purchased their permit. The number of individuals that was drawn was equal to 12% of the total number of people who purchased a permit for the spring season (n = 4,903). An e-mail was sent to those individuals 4 days after the close of the season (June 4) asking them to complete an online questionnaire about their hunting activity and harvest during the 2012 season (Figure 2). Those people receiving an e-mail were offered a chance at a framed wild turkey print or 10 KDWPT magazine subscriptions if they completed the questionnaire by June 30. Non-respondents were sent two more subsequent follow-up e-mails on June 11 and June 26.

Results from the harvest survey were used to develop statewide estimates of the number of hunters participating in each season, harvest (by weapon and property ownership), perceived hunting pressure on publicly owned land and walk-in-hunting area (WIHA) tracts, hunter effort, harvest distribution, hunter success, and hunter satisfaction with Kansas turkey hunting and management. Many of these parameters were also calculated for each of the 6 new turkey management regions adopted this year (Figure 3). The new management units were created to better align with new hunt units which will be taking affect during the fall of 2012. All estimates back through 2005 were updated using the new regional assignments and the new figures and presented in this report.

#### RESULTS AND DISCUSSION

Of the selected sample, a total of 4,553 e-mails were deliverable and 2,572 usable responses were provided resulting in an adjusted response rate of 56.5%. An estimated 94.1% of the 41,876 initial permit buyers hunted turkeys during the spring 2012 season resulting in 39,386 active hunters (26,535 residents and 12,733 non-residents; Table 4). Those hunters spent an average of 4.5 days (95% CI = 4.3 - 4.7) in the field and accumulated an estimated 177,237 total efforts.

The estimated numbers of people participating in the early season as archers, youth, and disabled hunters were 6.819 (95% CI = 6.243 - 7.438), 2.604(95% CI = 2.508 - 2.703), and 260 (95% CI = 251 - 271), respectively. The estimated number of people to hunt with a crossbow during the regular turkey season was 326 (95% CI = 211 - 502). The mean age of all the people purchasing a 2012 spring turkey permit was 38.5 and their age distribution was bimodal with a high number of youth hunters (<18), fewer young adults (18-35), and the vast majority of hunters being middle-aged or older (>35; Figure 4).

Total harvest during the spring 2012 season was 31,239 turkeys of which 10.1% was taken with archery equipment and 0.7% was taken with a crossbow (Table 4). The age and sex structure of the 2012 harvest was 83.7% adult gobblers, 15.1% jakes, and 1.2% bearded hens. The percentage of turkey hunters taking at least 1 bird was 60% during the 2012 season. The overall success rate has been >60% for 10 of the last 11 spring turkey seasons in Kansas. Initial permit success was again higher than game tag success and non-residents were more successful than residents (Table 5). On a statewide scale, the percentage of the

harvest taken with a second turkey game tag was 24.4% in 2012 (Table 4). Hunting pressure on publicly owned lands and WIHA was generally considered to be light to moderate by resident and non-resident hunters using those property types during the spring 2012 season (Figure 5).

During the spring 2012 season, 6.2% of the total harvest was taken on opening day of the regular season (Figure 6). Prior to the creation of the archery-only season in 2007 the percentage of total harvest taken on opening day was typically >10%. The special early seasons not only provide unique opportunities but they spread out the harvest which helps to slightly lessen the number of hunters in the woods during the regular season. By the end of the  $5^{th}$  day of the regular season an estimated 39.8% of the total 2012 harvest had already occurred and by the end of April that percentage was estimated to be 76.6% (Figure 6).

The greatest number of hunters and harvest occurred in the northeast management region where >14,000 hunters harvested nearly 11,000 birds during the spring 2012 season (Figure 7). The number of hunters and harvest have increased since 2005 in the northwest, north-central, and southwest management regions; remained stable in the south-central and northeast region; and declined in the southeast region. The percentage of jakes in the harvest was low (<20%) in every management region during the spring 2012 season but especially in the southwest (2.8%) where few jakes were available due to severe drought during the 2011 reproductive season (Figure 8). Hunter success was greatest in the northwest management region where an estimated 73% of all active hunters harvested at least one bird (Figure 8). Hunt success was lowest in the southeast management region where an estimated 53% of active hunter harvested at least one bird. Hunt success in the southeast management region has been depressed in recent years due to extremely low turkey production that occurred across the region in 2007 and 2008. However, hunt success has started to improved over the last couple of years due to average or above average production during each of the last 3 summers and production appears to have been very good during the summer of 2012. Thus, hunter success will likely continue to improve in the southeast region in the coming years.

The greatest number of hunters utilized the WIHA properties in the northeast (2,629), north-central (1,992), and northwest (833) regions during 2012 (Table 6). Correspondingly, the greatest WIHA harvest occurred in the same 3 regions (122-658 birds; Table 6). During the 2012 season a similar number of people hunted spring turkeys on publicly owned properties (6,842) and WIHA tracts (6,515). Nearly 30% of all spring turkey hunters in Kansas utilized properties either provided (WIHA) or managed by the KDWPT or other federal agencies (e.g. U.S. Fish & Wildlife Service, U.S. Forest Service, etc.). Of the 3 major land types, the greatest number of spring turkey hunters and harvest were both associated with private land in each of the 6 management regions. Private land was used by 83% of all active hunters and a similar percentage of the statewide harvest occurred on those properties.

Spring turkey hunters in Kansas were generally satisfied or very satisfied (>75%) with turkey management and hunting on a statewide scale but satisfaction has declined over the last 7 years (Figure 9). The same declining pattern has been observed regionally for the northeast, southeast, and northwest management regions (Figure 10). Declines in the northeast and southeast regions are probably associated with depresses hunter success in recent years compared to the peak in the mid 2000s. The declining trend in satisfaction reported by hunters in the northwest region is not understood because hunter success in that region is the highest in the state and public access opportunities have continued to improve (Figure 10).

<sup>&</sup>lt;sup>a</sup> Includes all resident permits regardless of age through 2007 and only those ≥16 after that point.

b Includes non-resident archery, firearm, and the universal non-resident permit that is currently issued.

<sup>&</sup>lt;sup>c</sup> Includes all landowner/tenant (LO/T) permits, hunt-own-land permits, and non-resident landowner permits.

<sup>&</sup>lt;sup>d</sup> Game tags for spring turkey season were not issued until 1991 and separate tags for residents and non-residents were not issued until 2004. The total includes both resident and non-resident game tags.

<sup>&</sup>lt;sup>e</sup> Does not include the cost of a small game license which is required to hunt turkeys.

f NT = No tag issued.

<sup>&</sup>lt;sup>g</sup> The value in parentheses was the number of game tags issued to non-residents.

<sup>&</sup>lt;sup>a</sup> WIHA = walk-in-hunting areas.

<sup>&</sup>lt;sup>b</sup> Many hunters reported hunting on more than one land type. Thus, the sum of the estimates will be greater than the estimated number of active hunters within each region.

 $<sup>^{</sup>c}ND = no data.$ 

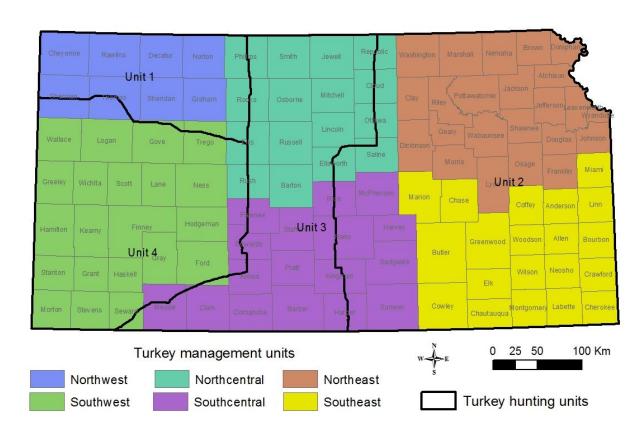

Figure 1. The spring wild turkey hunting and management units in Kansas, 2012.

#### Figure 2. Spring 2012 Kansas wild turkey harvest questionnaire.

- 1. What is your KDWP number? Your unique identification number is printed on the front side of the postcard you received and can also be found on any KDWP licenses or permits you have purchased.
- 2. Are you a permanent resident of Kansas?
  - 1 Yes
  - 2 No
- 3. What is your county of residence? (only answer if you are a resident of Kansas)
- 4. Did you hunt turkeys in Kansas during the spring 2012 season? (If you answer 'NO' proceed to question 14)
  - 1 Yes
  - 2 No

### Figure 2. Continued...

Everyone should answer questions 15-17.

- 15. How would you best describe your satisfaction with the Kansas turkey management program?
  - 1 Very Dissatisfied
  - 2 Dissatisfied
  - 3 Uncertain
  - 4 Satisfied
  - 5 Very Satisfied
- 16. Which of the following best describes your satisfaction with Kansas turkey hunting?
  - 1 Very Dissatisfied
  - 2 Dissatisfied
  - 3 Uncertain
  - 4 Satisfied
  - 5 Very Satisfied
- 17. Please include any additional comments. Thank you for your time!

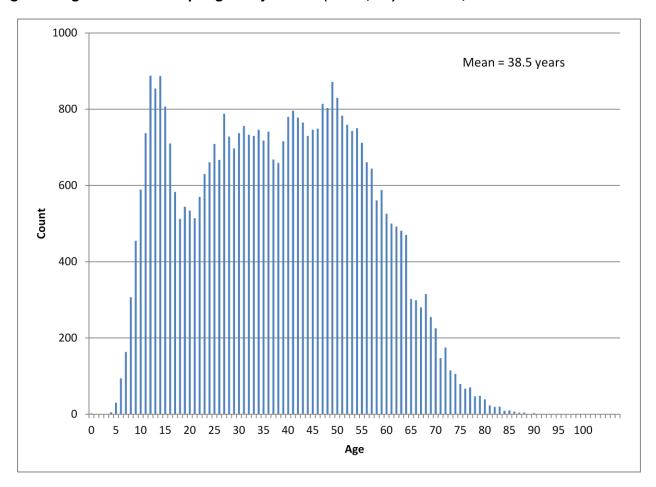

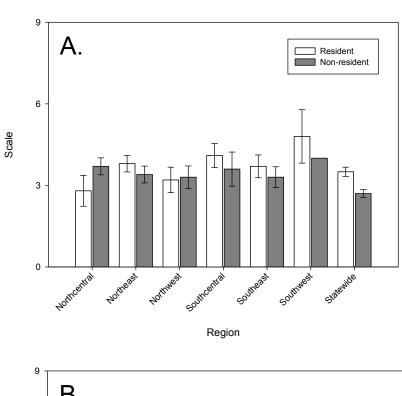

Figure 5. Regional and statewide indices to hunting pressure on publicly owned areas (A.) and walk-in-hunting areas (B.) as ranked by resident and non-resident hunters who participated in Kansas' spring turkey season, 2012. The error bars indicate 95% confidence intervals. Individuals who hunted one of these property types ranked hunting pressure on a scale of 1-9 with one being lightest and 9 being heaviest.

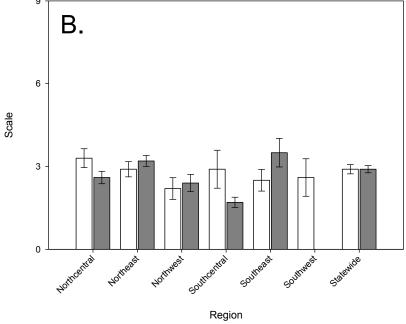

Figure 6. Daily (A) and cumulative (B) harvest distribution during the spring 2012 wild turkey seasons in Kansas. The black bars on the daily distribution histogram indicate the weekends. The dashed line on the cumulative graph is a reference line at the  $50^{th}$  percentile.

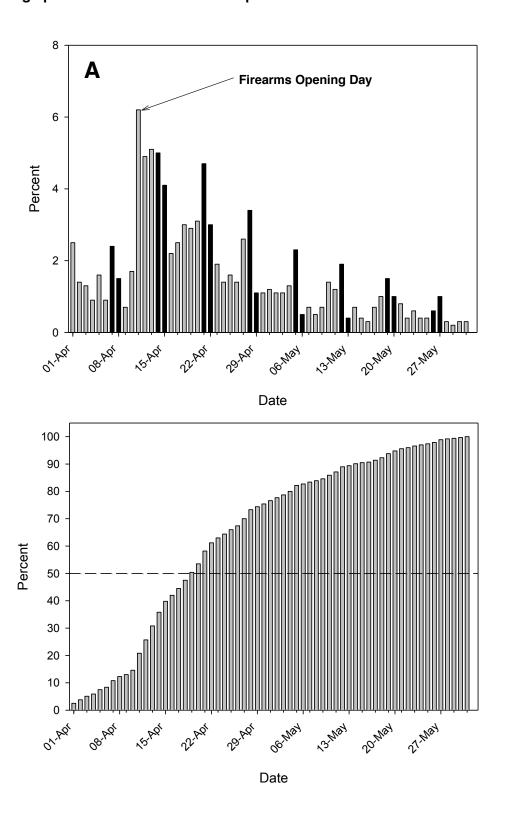

Figure 7. Regional estimates of spring wild turkey hunter numbers and harvest in Kansas, 2005-2012. The error bars represent the 95% confidence intervals. Note that graphs have different y-axis scales.

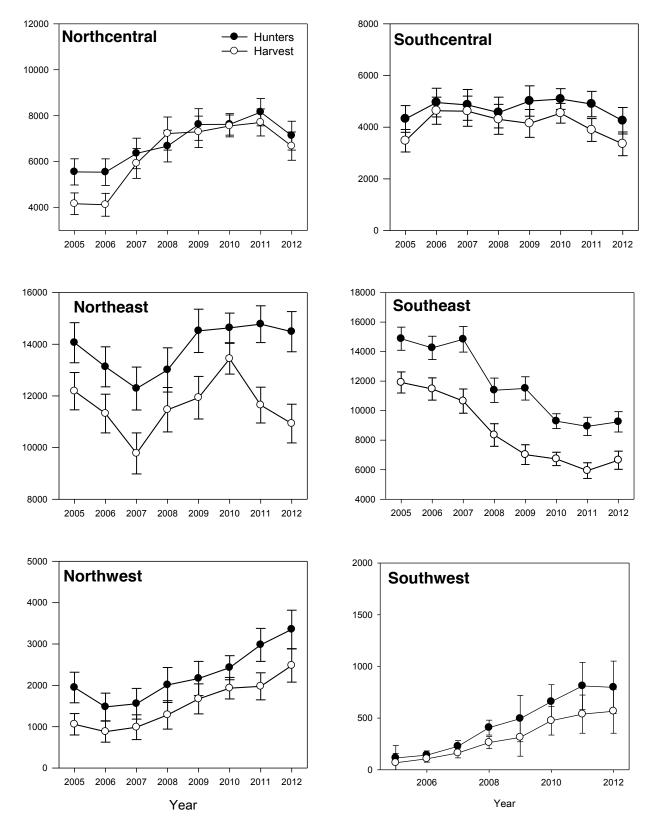

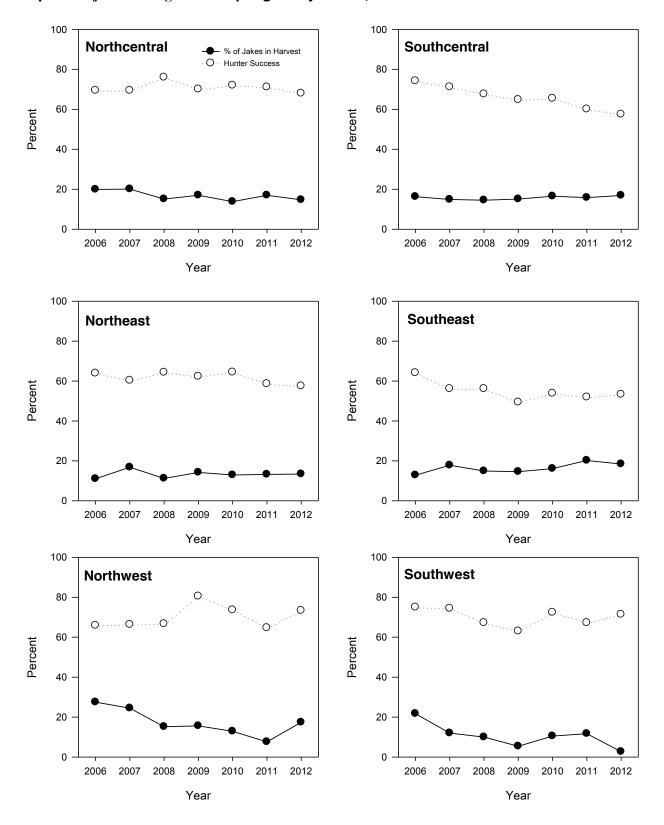

Figure 8. Percent of active turkey hunters harvesting at least one bird and the percentage of harvest composed of jakes during Kansas' spring turkey seasons, 2006-2012.

**Figure 9.** Statewide percentage of Kansas wild turkey hunters that indicated they are 'satisfied' or 'very satisfied' with management and hunting, 2005-2012.

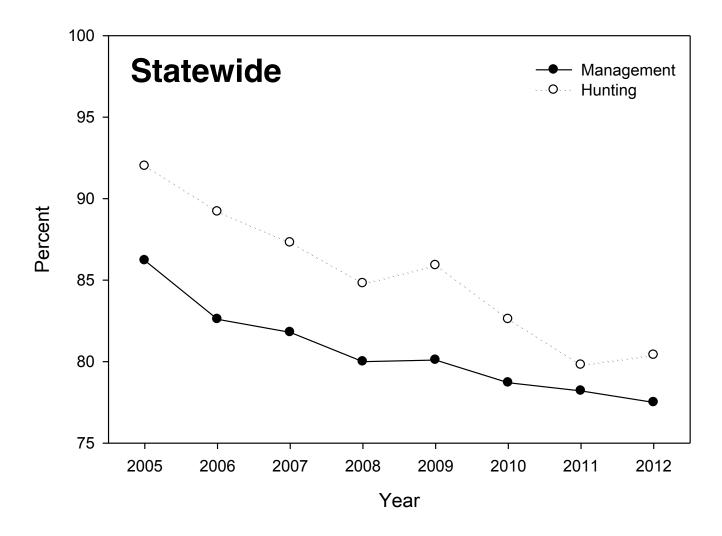

Figure 10. Regional percentages of Kansas wild turkey hunters indicating that they are 'satisfied' or 'very satisfied' with management and hunting, 2005-2012.
